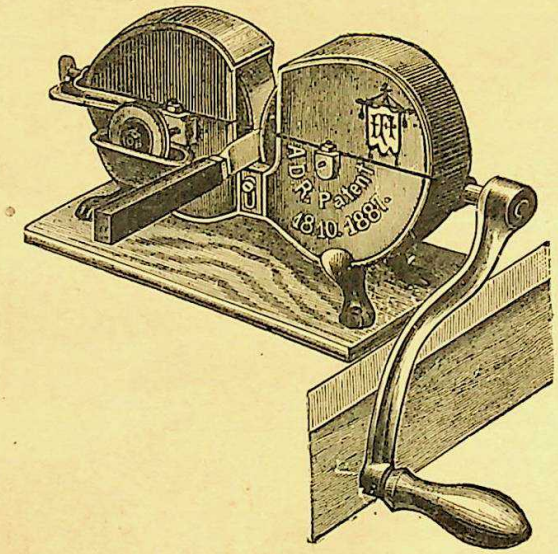
The "Indispensable" Knife-cleaning Machine.

NOVELTIES in practical and economical domestic machines are the specialty of Mr. Hugo Sommerfield, of 10, Long-lane, London, E.C. One of his latest devices is the patent "indispensable" machine for cleaning knives and forks for which many advantages are claimed, such as an easy movement and non-liability to wear out knives and forks. The "indispensable" is cheap, simple, and durable. It is thoroughly well



made, and so constructed that it will last for many years, even if continually in use. It is, therefore, well adapted not only for families, but also for hotels, restaurants, &c. The "indispensable" cleans knives and forks of any size, as the space between the friction wheels can be easily regulated. It gives the knives the appearance of new ones, and keeps them always sharp. The springs are made of covered steel, and are firmly joined to the wheels. This introduction of steel is a decided advantage over all other machines. Invention 4/14/88—357.
